

# User Testing Performed by Mitchell

## Scenarios

1. Create a food entry representing a Red Delicious apple.
2. Clear all of your data from the app's storage without using the Android "App Info" menu.
3. You've just eaten a peanut butter sandwich made from two slices of bread and two tablespoons of peanut butter. Record this sandwich in the diary.

## User Testing

### Results

The above scenarios were performed by a single user who played no part in the app's development. This user successfully completed all of the scenarios in a reasonable amount of time. They gave some feedback on the obstacles they encountered but overcame.

### Feedback

- The food spinner next to the "Food" label doesn't stand out as being a drop-down box
- It isn't clear what the number below the food's name represents
- It's not obvious what you should be entering in the text field next to the "Servings" label

A screenshot of a mobile application interface for creating a diary entry. It features two main input sections. The first section has a label 'Food' on the left, followed by a text input containing 'Apple' and a small downward-pointing triangle indicating a dropdown menu. Below 'Apple' is a smaller text input containing '336.62 grams'. The second section has a label 'Servings' on the left, followed by a text input containing '2.000000'.

Example of diary entry creation for reference

### Suggested Changes

- A thin border around the food spinner would make it stand out better
- Putting a colon at the end of the "Food" and "Servings" labels would make it clearer that the labels are related to the input elements to their right
